S-A-S

Higher performance, lower costs

The compaction operation with the Matrix loading wall allows the full cargo volume to be used.

The firm S-A-S Spezielle-Agrar-Systeme GmbH is represented with two innovations at this year's Agritechnica. The first is the further development of the Matrix loading wall showed jointly with the loader wagon manufacturer Strautmann at the last exhibition two years ago. The new moving stowage panel Matrixinside HK is now also suitable for use in loader wagons without dosing rollers. This makes it possible for the first

In the Matrix-Combi the crop is blown in via a loading hopper mounted over the rotor.

time to use the full compacting performance right from the start of loading and to fill the entire cargo space completely. This cost-cutting forage collection system can be retrofitted on all loader wagons. The special advantages for developers lie in distinct savings in travel requirements during forage harvesting, higher road safety and savings in diesel fuel.

The MatrixCombi, the second innovation, harnesses the

compaction performance of loader rotors in loader wagons for transporting chopped material too.

Better utilisation rate for loader wagons

The chopper no longer blows the material into the cargo compartment, but instead into the filling hopper above the rotor.

This compacts the material continuously and presses it into the cargo compartment. The wagon capacity is thus increased to 2.5 times the normal cargo volume. In addition to these advantages, the system is ideal for expanding the job potentials of loader wagons. Transport expenditure can be reduced by up to two thirds. Hall 27, Stand D18
